CLAIMS:

1. A catheter assembly which includes:

at least one introducer, the at least one introducer defining at least one passage;

an elongate tubular member slidably received within the at least one passage of the at least one introducer, the tubular member having a proximal end and a distal end and at least one lumen extending between the proximal end and the distal end; and

an elongate, shape-imparting element received in the at least one lumen of the tubular member, the shape-imparting element imparting a predetermined shape to the distal end of the tubular member when the distal end of the tubular member is extended beyond a distal end of the introducer, a distal end of the shape-imparting element extending from the at least one lumen of the tubular member and being anchored proximally a distal end of the introducer.

- 2. The assembly of claim 1 in which a proximal end of the shape-imparting element is connectable to a control mechanism which, in use, applies torsion to the shape-imparting element to effect adjustment of the predetermined shape of the distal end of the tubular member.
- 3. The assembly of claim 1 or claim 2 in which the predetermined shape imparted to the distal end of the tubular member is a loop formation.
 - 4. The assembly of claim 3 in which the tubular member forms a cranked arm when it is extended from its introducer, the cranked arm being arranged transversely with respect to a longitudinal axis of the introducer and the cranked arm leading into a spiral shape forming the loop formation.
 - 5. The assembly of claim 4 in which the spiral shape circumscribes at least 360°.
 - 6. The assembly of claim 4 in which the spiral shape circumscribes about 540°.
 - 7. The assembly of any one of claims 4 to 6 in which the cranked arm extends from the end of the introducer at an included angle of about, or exceeding, 90° to facilitate the formation of a substantially planar loop formation at the distal end of the introducer.

- 8. The assembly of any one of the preceding claims in which the assembly includes at least two introducers, each introducer having a tubular member associated with it.
- 9. The assembly of claim 8 in which a first introducer is received within a passage of a second introducer, a second tubular member, associated with the second introducer, being slidably received within a passage of the second introducer.
- 10. The assembly of claim 9 in which the second tubular member is carried on a shape-imparting element received within a lumen of the second tubular member so that
 10 the second tubular member is able to be formed into a second predetermined shape when the second tubular member is extended from the second introducer.
 - 11. The assembly of claim 10 in which the shape-imparting element associated with the second tubular member extends beyond a distal end of the second tubular member.
 - 12. The assembly of claim 11 in which a distal end of the second shape-imparting element is anchored distally with respect to the distal end of the second tubular member but proximally with respect to the distal end of the first introducer.
- 20 13. The assembly of claim 12 in which an anchor point of the first shape-imparting element is in register with an anchor point of the second shape-imparting element.
 - 14. The assembly of claim 13 in which both anchor points are arranged on the first introducer.
 - 15. The assembly of any one of claims 10 to 14 in which each shape-imparting element is in the form of a shape memory alloy wire.
 - 16. A catheter assembly which includes:
- at least one introducer, the at least one introducer defining a passage;
 - an elongate, tubular member slidably received within the passage of the at least one introducer, the tubular member having a proximal end and a distal end and a lumen extending between the proximal end and the distal end; and
- an elongate, shape-imparting element received in the lumen of the tubular 35 member, a distal end of the shape-imparting element extending beyond a distal end of the tubular member and being anchored proximally a distal end of the introducer, the

arrangement being such that, when a distal portion of the tubular member is extended beyond the distal end of the introducer, the shape-imparting element imparts, to the distal portion of the tubular member, a cranked arm portion extending transversely relative to a longitudinal axis of the introducer and a loop formation supported on the arm portion so that torsion imparted to a proximal end of the shape-imparting element causes rotation of the arm portion about the longitudinal axis of the introducer to effect adjustment of a diameter of the loop formation of the distal portion of the tubular member.
